Education

McGill University Sep 2020 — Apr 2025
B.Sc. Computer Science GPA: 3.78

Experience

Associate Software Engineer Mar 2025 — Present
UKG — Montreal, QC

- Re-architected result delivery for the Schedule Generator, a core feature used by **10,000+ customers**, moving it to WebSockets with a polling fallback for dropped connections, so schedules return **1.5x faster** than the previous solution.
- Shipped an **LLM-powered**, one-click self-scheduling feature in Angular/TypeScript that drafts each employee's shift requests from their historical preferences, shaping requirements directly with product managers, designers and enterprise customers.
- Rebuilt the filtering logic behind employee search in UKG's workforce management modules, making it faster for users to find the right people across enterprise-scale employee rosters.
- Cut application load times by making the caching layer detect no-op CRUD updates (requests carrying no actual changes) and skip the redundant database writes they triggered.

Software Engineer May 2024 — Feb 2025
Onyx Technologies — Montreal, QC

- Built a machine learning pipeline that extracts and formats enterprise data for model training, and exposed its predictions through a RESTful API.
- Built a reusable "Help & Guidance" framework of context-specific modals and video tutorials, used across all custom UI components to speed up user onboarding.
- Designed a recommendation engine that matches users to their best-fit business units from individual preference profiles.
- Improved front-end speed by **66%** by building and customizing Lightning Web Components (LWC) in ES6+ and optimizing data fetching.

Software Developer Intern Jan 2023 — May 2023
Clinia — Montreal, QC

- Revamped scraping algorithms using C# and ASP.NET, reducing resource consumption by **30%**.
- Developed and maintained multiple ETL pipelines, keeping data workflows stable.
- Improved code quality by writing testable code covering critical edge cases with robust exception handling.

Projects & Outside Experience

Fireside | *React Native, Expo, JavaScript, Supabase, PostgreSQL* Oct 2025 — Present · Lead Developer

- A social reading app where readers track books, keep streaks alive through quests and XP, and match with others on overlapping taste. Built end to end, from the Postgres schema to the mobile UI.
- Designed the Supabase/PostgreSQL backend with row-level security and SECURITY DEFINER RPCs, so match scoring runs server-side without ever exposing strangers' shelves.
- Made XP server-authoritative: a single RPC decides every award, and a partial unique index on dedupe keys makes awards idempotent.
- Built realtime 1:1 chat with a polling fallback, plus a single write path that keeps reading progress, sessions, streaks and XP in sync.

FaceScan | *React Native, TypeScript, Supabase, Gemini API* Nov 2025 — Present · Lead Developer

- An AI wellness tracking app that turns facial analysis into personalized health insights, with a serverless backend, push notifications and in-app subscriptions.

Technical Skills

Languages: TypeScript, JavaScript, Python, SQL, Java, C#, HTML / CSS
Frameworks & Libraries: Angular, AngularJS, React, React Native, Expo, ASP.NET
Tools & Platforms: PostgreSQL, Supabase, WebSockets, RESTful APIs, Git, Salesforce LWC, Claude Code
